

9. Chapter-9 (Position)

__/__/__

★ What is position?

- position controls where an element is placed on the page.

X position se hum decide karte hain ki element page par kahan rahega.

i) position: static

- Default position of every element

X Ye element ka normal position hoti hai.

Example:

```
.box {
```

```
    position: static;
```

```
}
```

ii) position: relative

- The element stays in its normal position, but can be moved from there.

X Element apni normal jagah par rahta hai lekin ham log usko age, piche, left, right kar sakte hai.

Example:

```
.box {
```

```
    position: relative;
```

```
    top: 20px;
```

```
    left: 30px;
```

```
}
```

Normal position

Box

top: 20px

left: 30px

Box

iii) position : absolute

- Positions an element relative to its nearest positioned parent.

X Element apne nearest positioned parent ka according place hota hai.

Example:

```
.parent {
```

```
    position : relative;
```

```
}
```

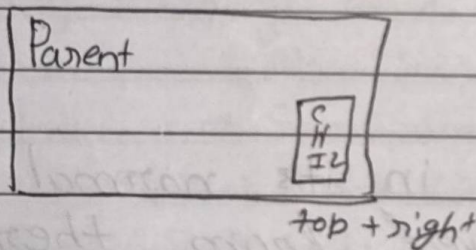

```
.child {
```

```
    position : absolute;
```

```
    top : 10px;
```

```
    right : 10px;
```

```
}
```

iv) position : fixed

- The element stays fixed relative to the browser window.

X Element Screen par fixed rakhta hai scroll karne par bhi nahi hilti.

Example

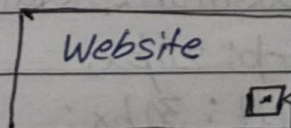

```
.chat {
```

```
    position : fixed;
```

```
    bottom : 20px;
```

```
    right : 20px;
```

```
}
```

* Use in chat button, floating button, fixed navbar.

v> position: sticky

- The element sticks to a specified position when you scroll.

X Element scroll karte waqt ek position par chipak jate hai.

example:

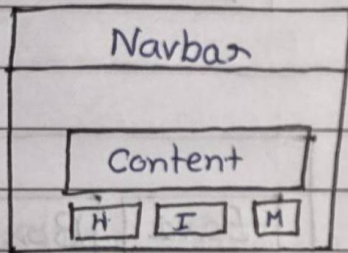

• navbar {

position: sticky;

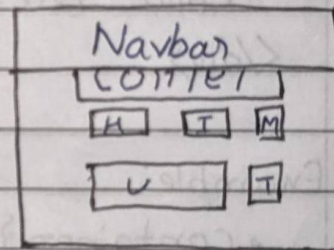

top: 0;

}

Before scroll

After scroll

→ Cheat Sheet

Position	Meaning
static	Default / Normal
relative	Normal jagah se agge piche karina
absolute	Parent ke according position
fixed	Screen par fixed
sticky	Scroll par stick

10. Capten Flexbox

__/__/

→ What is flexbox?

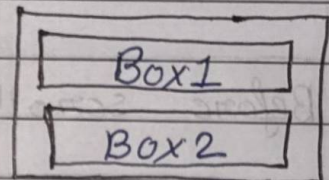

- Flexbox is a CSS layout system used to arrange elements easily in a row or column.

X Flexbox ke use HTML element ko ek line me arrange kar deta hai ya center, left/right ya upan/neeche arrange karne ke liye hota hai.

example:

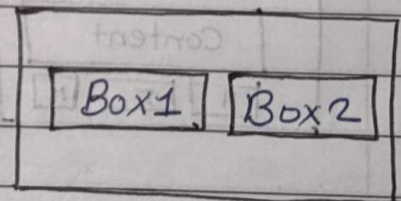

```
<div class="container">  
  <div> Box 1 </div>  
  <div> Box 2 </div>  
</div>
```

Output:

Example:

```
• container {  
  display: flex;  
}
```

<P> Flex Container & Flex Items

Flex Container

- Jis parent element par:

display: flex;

- lagate hain, woh Flex Container hota hai.

Flex items

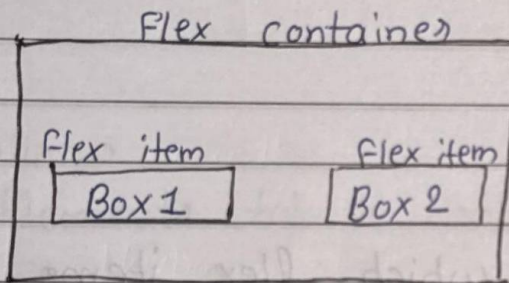

- Flex container ke direct children ko Flex items kehte hain.

example:

```
<div class="container">  
  <div> Box 1 </div>  
  <div> Box 2 </div>  
</div>
```

CSS:

```
.container {  
  display: flex;  
}
```

- .container → Flex Container
- Box 1 → Flex Item
- Box 2 → Flex Item

i) display : flex

- ~~flexbox is a CSS layout~~
- Flexbox start karne ke liye sabse important property:

display : flex;

Example:

```
<div class="container">  
  <div> 1 </div>  
  <div> 2 </div>  
  <div> 3 </div>  
</div>
```

CSS

```
.container {  
  display: flex;  
}
```

Output:

without Flexbox

1

2

3

with display : flex .

1

2

3

ii) flex-direction

- The direction in which flex items are arranged inside a flex container.

X flex-direction decide karta hai ki flex items kis direction mein arrange honge.

Syntax,

• container {

display : flex ;

flex-direction : value ;

}

row

row-reverse

column

column-reverse

- row
 - Default direction (Elements left to right aayenge)

flex-direction: row;	1 → 2 → 3
----------------------	-----------

- row-reverse
 - Element ki direction reverse ho jayegi

flex-direction: row-reverse;	3 → 2 → 1
------------------------------	-----------

- column
 - Elements top to bottom aayenge.

flex-direction: column;	1 ↓ 2 ↓ 3
-------------------------	-----------------------

- column-reverse
 - ~~Elements~~ Elements bottom se top ki direction mein arrange honge.

flex-direction: column-reverse;	3 ↓ 2 ↓ 1
---------------------------------	-----------------------

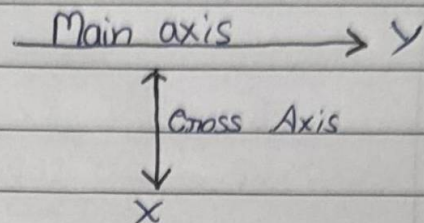

Quick Revision

value	Arrangement
row	→ 1 2 3
row-reverse	← 3 2 1
column	↓ 1 2 3
column-reverse	↑ 3 2 1

* Main Axis & Cross Axis

Flex box mein 2 axis hote hai

- Main Axis
- Cross Axis

Default flex-direction: row hota hai

→ Remember

justify-content → Main Axis
align-items → Cross Axis

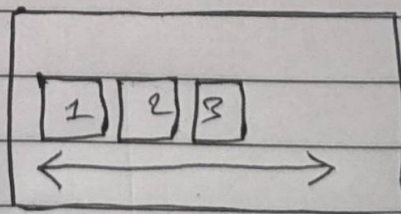

Main axis = Jis direction mein items arrange ho rahi hain.

Cross axis = uske opposite direction

→ justify-content

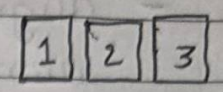

- justify-content ka use to align flex items along the Main Axis.

X justify-content ~~generally~~ ka use boxes ko Main axis ke according position karne ke liye hota hai.

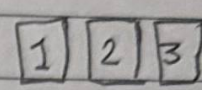

i) flex-start

justify-content : flex-start;

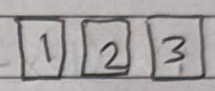

ii) flex-end

justify-content : flex-end;

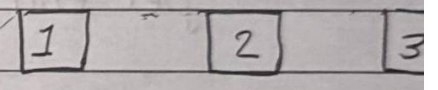

(iii) Center

justify-content : center;

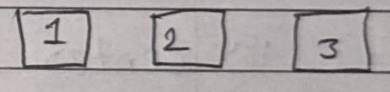

iv) space-between

justify-content : space-between;

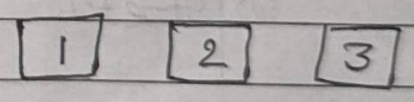

v) space-around

justify-content : space-around;

vi) space-evenly

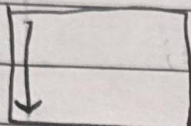

justify-content : space-evenly

→ align-items

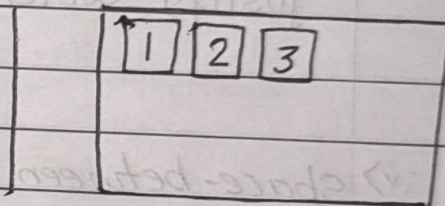

- align-items is used to align flex items along the Cross Axis

X align-items ka use boxes ko Cross Axis par align karne ke liye hota hai.

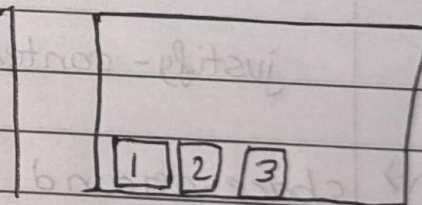

i) flex-start

~~align-items: stretch;~~
align-items: flex-start;

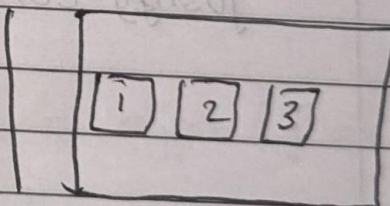

ii) flex-end

align-items: flex-end;

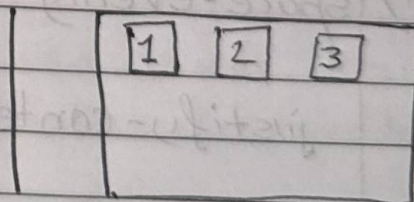

iii) Center

align-items: center;

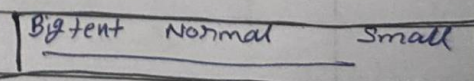

iv) stretch

align-items: stretch;

v) baseline

align-items: baseline;

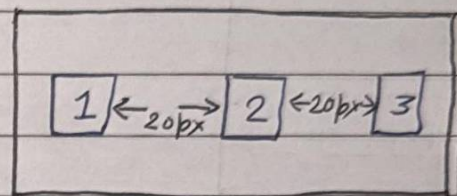

→ gap

- Creates space between Flex Items.

X gap ka use boxes ke beech distance dene ke liye hota hai.

example:

```
.container {  
  display: flex;  
  gap: 20px;  
}
```

→ flex-wrap

→ flex-wrap allows items to move to the next line when there is not enough space.

X Agar container mein space kam pad jaye, toh items next line mein bhejne ke liye flex-wrap use karte hain.

example

```
.container {
```

```
  display: flex;
```

```
  flex-wrap: wrap;
```

```
}
```

nowrap

wrap

wrap-reverse
